# How do I properly install the Triton™ Driver in Windows XP?

When installing Vantage Point software on your computer, it also copies the Triton™ driver to your C: Drive. You can locate the driver at C:\MagellanDrivers. Follow the steps below if you are having problems connecting your Triton to Vantage Point.

The error messages below display the possible messages you will receive when connecting the USB cable to your computer while your Triton is powered on.
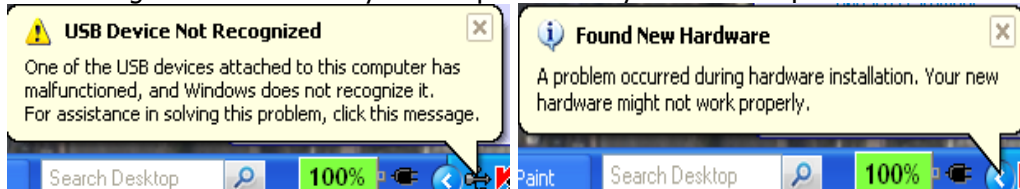

1. To resolve this problem right click on **My Computer**, left click on **Properties**. Click on the **Hardware** tab and then on the **Device Manager** button. Under ports you should see a yellow exclamation mark where it shows Triton™.
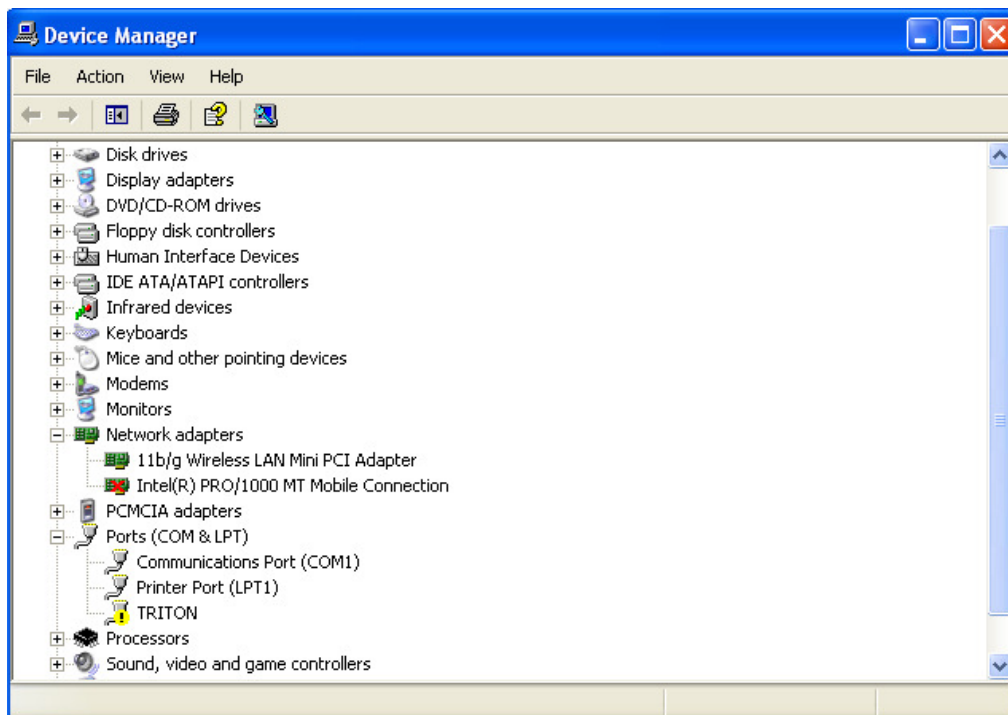

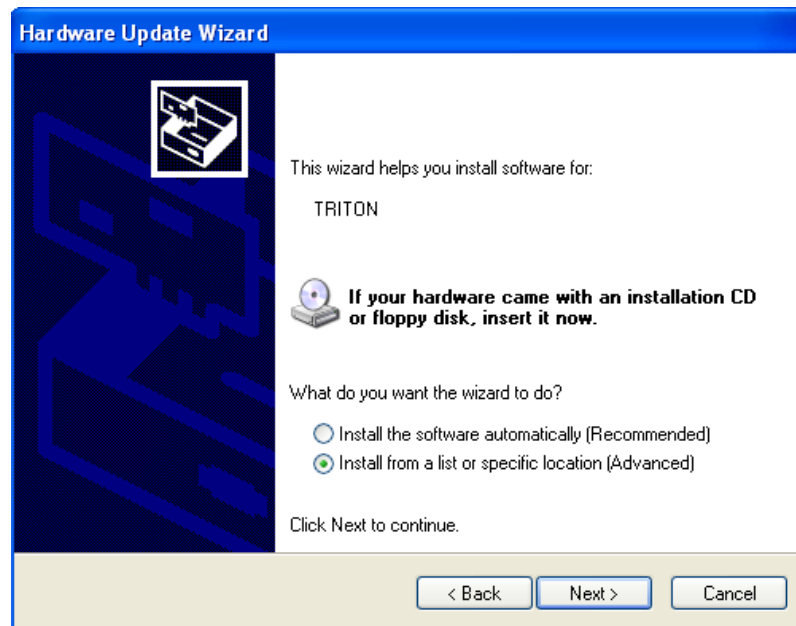

2. Right click on **Triton** and left click on **Update Driver**.
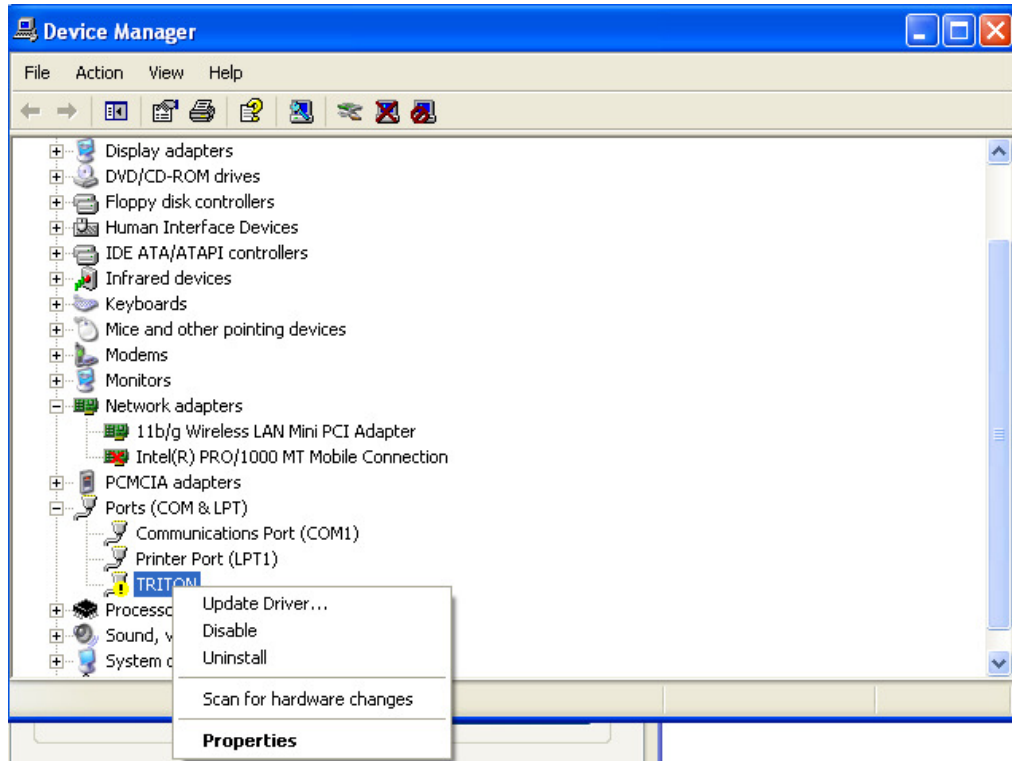

3. Select the third option – **No, not this time** – and click on **Next**.

4. To install the driver, select **Install from a list or specific location (Advanced)** and click **Next**.

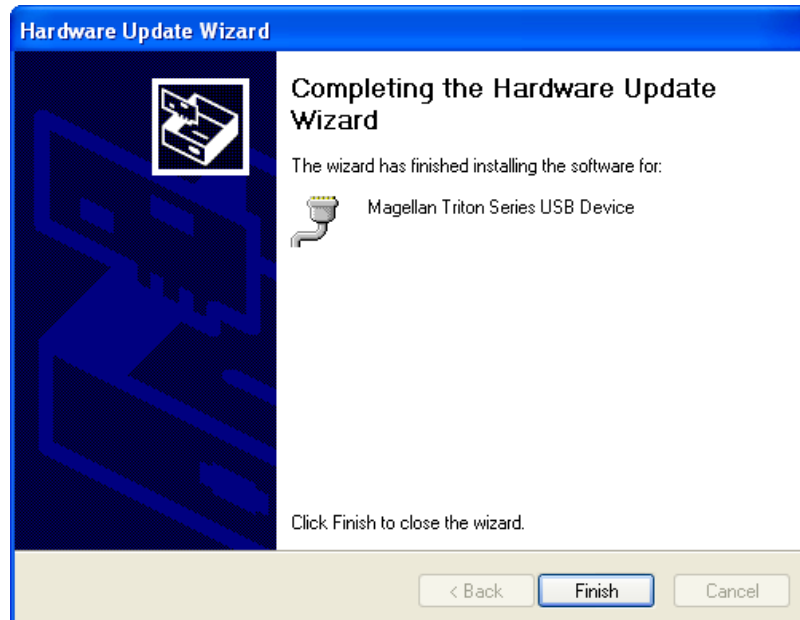

4. Next, put a check where it says **Include this location in the search**, then click on **Browse**. You will then need to browse to the **C Drive** and select the **MagellanDrivers** folder. When it is listed, click on **Next**.
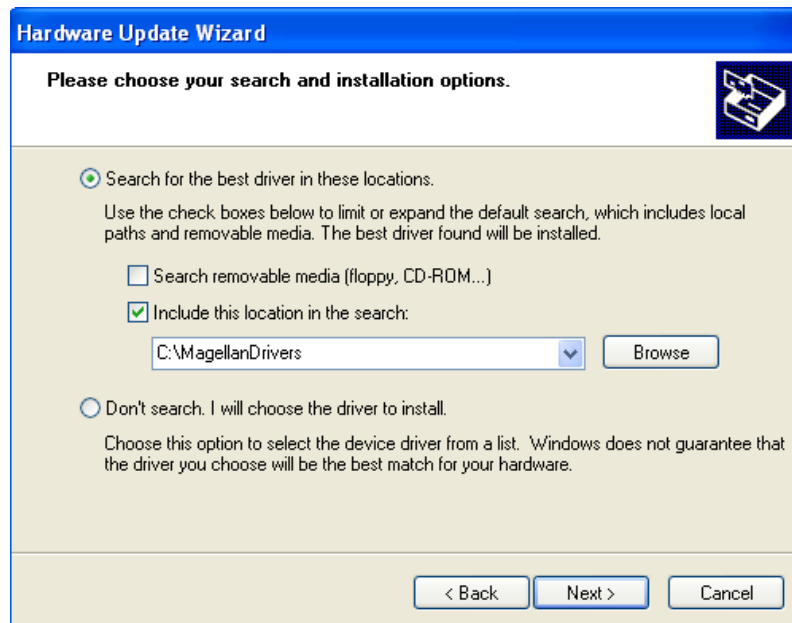

5. When the Windows Logo Testing screen comes up, click on **Continue Anyway** to complete the driver installation.
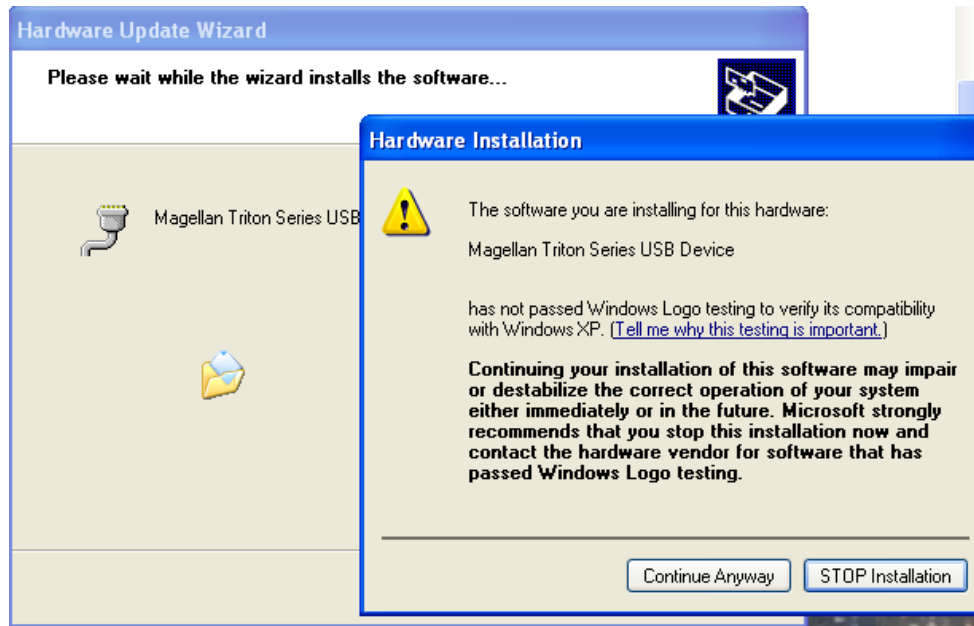

6. Click **Finish** to complete the driver installation.

6. Now your Triton driver should be listed without any yellow exclamation marks.
